CHAPTER 2: MARKET

2.1 MARKET SURVEY

2.1.1 Content survey

Survey Content: The survey was designed to collect information from potential customers regarding their awareness, needs, usage behavior, expectations, and acceptance of the J4S platform. The questionnaire consisted of 12 questions and was divided into the following main categories:

Screening Questions: To determine whether respondents have previously known about or used job-search websites and freelance platforms. This section helps evaluate customers' awareness of the online employment market and existing freelance platforms.

Customer Needs Assessment: To identify users' purposes for seeking jobs or freelance opportunities, such as increasing personal income, gaining practical experience, building a personal portfolio, or developing professional skills.

Job-Seeking Behavior Assessment: To explore the channels customers commonly use to search for employment opportunities or freelance projects, including Facebook, LinkedIn, YBOX, TopCV, referrals from friends, and other platforms.

Service Demand Assessment: To identify the types of services customers are interested in on the J4S platform, including graphic design, translation, presentation slide design, content writing, video editing, programming or website design, and other services.

Product Value Evaluation: To investigate the reasons why customers would like to use the J4S platform, including:

- A platform dedicated specifically to students.
- Easy access to short-term jobs that match users' skills.
- Reasonable freelancer hiring costs.
- Verification mechanisms that increase trustworthiness.
- A two-way rating system between clients and freelancers.
- AI-powered job or candidate recommendation features.

Identifying Dissatisfaction with Existing Platforms: To examine the difficulties customers currently face when using job-search or freelance platforms, including:

- Difficulty finding suitable jobs.
- Excessive competition.
- Fake accounts or lack of transparency.
- Incomplete job information.

- Difficulty evaluating partner credibility.
- Time-consuming communication and collaboration processes.

Feature Demand Assessment: To identify the features customers would like J4S to prioritize, including:

- User identity verification.
- Transparent rating and feedback systems.
- AI-powered job or freelancer recommendations.
- Direct messaging systems.
- Job progress and deadline management.
- Secure escrow payment systems.
- Student-focused portfolio profiles.

Platform Preference Assessment: To determine which channel customers would prefer to use for J4S, including a website, mobile application, or both.

Willingness-to-Pay Assessment: To evaluate customers' willingness to pay for premium platform features and determine appropriate pricing for future service packages.

Collecting User Suggestions: To gather users' opinions and recommendations for improving the product, features, and overall user experience of the J4S platform.

Demographic Information: To collect basic information regarding respondents' age and gender for customer segmentation and market analysis purposes.

Google Form Survey Link:

https://docs.google.com/forms/d/e/1FAIpQLSeSaG1nO0lIiNkDYbfIBPELi4JklOyhltFPw0VvWXvG6-bngw/viewform?usp=send_form

Survey Methodology: The team employed a quantitative research method using an online questionnaire designed through Google Forms. The survey was distributed through student groups, learning communities, student clubs, and the personal networks of team members. The collected data were compiled, cleaned, and analyzed using descriptive statistical methods to evaluate market demand, customer behavior, and the suitability of the J4S project.

Survey Period: From June 9, 2026, to June 13, 2026.

Survey Location: Online survey conducted nationwide, primarily targeting students at Vietnamese universities.

Survey Participants: University students, recent graduates, freelancers, and individuals seeking short-term employment opportunities or freelance services.

Number of Respondents: 110 participants.

Number of Survey Samples Included in the Analysis: 103 valid responses after data screening and cleaning.

2.1.2 Result evaluation

2.1.2.1 Awareness of Job Search and Freelance Platforms

Câu 1. Anh/chị đã từng biết hoặc sử dụng các website tìm việc làm hoặc nền tảng freelance chưa?
110 câu trả lời

With 93.7% of respondents having either used or been aware of freelance platforms, it can be concluded that J4S's target market already possesses a relatively high level of awareness regarding online job-matching platforms.

From a student perspective, this indicates that searching for employment opportunities through digital channels has become a common habit. Students no longer rely solely on traditional channels such as employment centers or personal connections but actively seek career opportunities through online platforms. This demonstrates a high level of technological readiness among the target audience and their ability to adopt digital products such as J4S.

From a market perspective, this result indicates that the freelancer-client marketplace model has already been accepted by the market. As a result, market demand risk is significantly reduced because users already understand how such platforms operate.

For J4S, the survey provides strong evidence that the project does not need to convince customers to adopt an entirely new business model. Instead, J4S only needs to address the shortcomings users currently experience on existing platforms. This significantly reduces marketing costs during the early stages and shortens market entry time.

Level of support for the J4S idea: Very High.

2.1.2.2 Purpose of Seeking Jobs or Freelance Opportunities

Câu 2. Anh/chị hiện đang tìm kiếm cơ hội việc làm hoặc freelance với mục đích gì?

103 câu trả lời

The survey results indicate that 48.5% of respondents seek jobs to increase their income, while 32% seek practical work experience.

These findings suggest that students pursue employment opportunities for both financial and career-development reasons. Students not only need income but also require experience, skills, and practical achievements to prepare for the labor market after graduation.

This indicates that J4S's target market is not composed of short-term users only but has the potential to become a long-term user base. A student may begin with simple projects to earn additional income and later continue using the platform to build a portfolio, improve skills, and pursue higher-value projects.

From a business perspective, this creates greater opportunities for user retention. Users are motivated to return to the platform repeatedly throughout their academic journey rather than using it only once.

For J4S, these findings validate the decision to develop portfolio systems, competency evaluations, and work-history tracking features.

Level of support for the J4S idea: Very High.

2.1.2.3 Current Job Search Channels

Most Used Job Search Channels

- Facebook: 60%
- TopCV
- YBOX

Most Demanded Services

Câu 3. Anh/chị thường tìm kiếm việc làm hoặc dự án freelance thông qua đâu?

105 câu trả lời

Facebook accounted for the highest percentage at 60%, followed by TopCV and YBOX.

This indicates that users still rely heavily on general-purpose platforms rather than a specialized platform designed specifically for student freelancers.

Facebook offers a large user base but suffers from significant limitations, including fragmented information, difficulty verifying credibility, high scam risks, and a lack of transaction management mechanisms.

The fact that Facebook is the most popular channel does not necessarily mean users are satisfied with it. Instead, it suggests that the market is currently relying on an alternative solution because no better option is available.

This is a critical indicator of an existing market gap that J4S can exploit.

Furthermore, these findings help J4S determine its customer acquisition strategy. Since most target users are active on Facebook, it should become the primary communication and marketing channel during the project's launch phase.

Level of support for the J4S idea: High.

2.1.2.4 Services of Interest on the J4S Platform

Câu 4. Những dịch vụ nào anh/chị quan tâm trên một nền tảng như J4S? Có thể chọn nhiều đáp án
103 câu trả lời

The most popular services were Translation (45.6%), Content Writing (44.7%), Presentation Slide Design (40.8%), and Graphic Design (36.9%).

These results accurately reflect the current skill structure of university students. These services have relatively low entry barriers, are easy to learn, easy to practice, and are suitable for students with limited work experience.

From a platform operation perspective, this is a positive signal because J4S can quickly build a freelancer supply base without investing heavily in attracting high-level professionals.

From a customer perspective, these services are also among the most common needs of small businesses, startups, online stores, and student organizations. This increases the likelihood of successful transactions and improves marketplace liquidity.

The survey provides evidence that J4S's current MVP focuses on the service categories with the highest market demand.

Level of support for the J4S idea: High.

2.1.2.5 Reasons Customers Want to Use J4S

Câu 5. Lý do Anh/Chị muốn sử dụng nền tảng J4S? Có thể chọn nhiều đáp án

103 câu trả lời

63.1% selected the ability to find jobs that match their skills, surpassing technology-related factors such as AI.

This is a highly important finding. It demonstrates that users are less concerned about how advanced a platform's technology is and more concerned about whether the platform can solve their problems efficiently.

This proves that J4S's core value lies not in AI itself but in accurately matching employer requirements with student capabilities.

In addition, 45.6% of respondents valued the fact that J4S is specifically designed for students. This suggests that students have unique needs that are not fully addressed by current freelance platforms.

This finding serves as strong evidence validating J4S's Unique Value Proposition (UVP).

Level of support for the J4S idea: Very High.

2.1.2.6 Dissatisfaction with Existing Platforms

Câu 6. Điều gì khiến anh/chị chưa hài lòng ở các nền tảng tìm việc/freelance hiện nay? Có thể chọn nhiều đáp án

105 câu trả lời

The three largest issues identified were excessive competition (52.4%), fake accounts (51.4%), and difficulty finding suitable jobs (48.6%).

These findings indicate that users are not fully satisfied with the platforms they currently use. In other words, although many competitors exist in the market, important problems remain unresolved.

This is a significant indication that the market is not saturated in terms of value creation. Users remain willing to switch to a new platform if it provides better solutions to their current challenges.

From a startup perspective, this is one of the most valuable findings because it confirms the existence of real customer pain points—the fundamental factor determining whether a project is truly needed.

If J4S successfully implements identity verification, transparent rating systems, and AI Matching, the project could establish a strong competitive advantage.

Level of support for the J4S idea: Very High.

2.1.2.7 Features Desired by Users

Câu 7. Nếu sử dụng J4S, anh/chị mong muốn nền tảng ưu tiên phát triển tính năng nào? Có thể chọn nhiều đáp án

103 câu trả lời

Users prioritized AI-powered job or freelancer recommendations (50.5%), transparent rating systems (49.5%), and identity verification (39.8%).

These results indicate that market needs are fully aligned with the core features that J4S plans to develop.

This provides evidence that the team is not building the product based on assumptions but rather addressing needs that have been directly validated by customers.

From a product development perspective, the survey helps reduce the risk of investing in unnecessary features while allowing the team to prioritize resources toward the highest-value functionalities.

Level of support for the J4S idea: Very High.

2.1.2.8 Preferred Platform Channel

Câu 8. Nếu J4S được triển khai, anh/chị sẽ ưu tiên sử dụng nền tảng này trên kênh nào?

103 câu trả lời

50.5% of users preferred a website, while 42.7% wanted both a website and a mobile application.

These results indicate that developing a website first is fully aligned with target customer behavior.

For an early-stage startup, focusing on website development instead of simultaneously building both a website and mobile application significantly reduces development costs, operational expenses, and implementation time.

The survey findings directly support the team's MVP decision.

Level of support for the J4S idea: High.

2.1.2.9 Willingness to Pay

Câu 9. Anh/chị sẵn sàng chi bao nhiêu tiền mỗi tháng để sử dụng các tính năng nâng cao trên nền tảng?

103 câu trả lời

57.3% of users are willing to pay between VND 50,000 and VND 100,000 per month.

This is one of the most important findings regarding the project's financial feasibility.

Many startups fail not because they lack users, but because users are unwilling to pay.

In J4S's case, the survey indicates that most customers accept a pricing level similar to the proposed Membership Package of VND 99,000 per month.

This confirms that the proposed revenue model is not merely an assumption but is supported by actual customer demand.

Level of support for the J4S idea: Very High.

2.1.2.10 Demographic Characteristics

Câu 11. Độ tuổi của anh/chị:

103 câu trả lời

88.4% of respondents were between 18 and 23 years old.

This is precisely the target customer segment that J4S intends to serve from the beginning.

Therefore, the survey sample is highly representative and accurately reflects the needs of the primary customer segment. This increases the reliability of the market research and strengthens the business decisions based on the survey findings.

Level of support for the J4S idea: High.

2.1.2.11 Overall Evaluation of Survey Results

The survey results provide clear evidence of a genuine demand for a student-focused platform connecting short-term jobs and freelance opportunities in Vietnam. Most respondents are already familiar with online job-search and freelance platforms, indicating that the target market is prepared to adopt digital employment solutions. This significantly reduces the time and cost required for market education during the early stages of the project.

The findings also show that students engage in freelance work not only to earn additional income but also to gain practical experience, develop professional skills, and build personal portfolios. This confirms that J4S's target users have both short-term and long-term motivations to use the platform, creating favorable conditions for user acquisition and retention.

In addition, the survey highlights several weaknesses of existing platforms, including excessive competition, fake accounts, difficulty finding suitable jobs, and a lack of transparency during the matching process. These findings confirm the existence of real market problems that J4S seeks to address. At the same time, the most desired features—AI-powered job recommendations, transparent rating systems, and identity verification—align closely with J4S's product development direction.

The survey also indicates that the service categories prioritized in the J4S MVP, such as content writing, translation, presentation slide design, and graphic design, are among the services most desired by users. This demonstrates that the team's product development strategy aligns with actual market demand. Furthermore, users' willingness to pay is consistent with the proposed Membership Package, thereby supporting the financial feasibility of the business model.

Finally, the demographic structure of the survey sample closely matches the project's target audience, with most respondents being between 18 and 23 years old. This increases the reliability of the research findings and ensures that the conclusions accurately reflect the needs of the target market.

Overall, the survey results demonstrate that J4S has strong potential to satisfy a genuine market need. The research not only confirms the existence of demand for a student-focused freelance platform but also validates that J4S's core values, key features, and business model align with customer expectations. Therefore, the project has a solid practical foundation for continued development and implementation in the next stage.

2.2 OVERALL MARKET ANALYSIS

2.2.1 Market size

The Freelance Market and Gig Economy in Vietnam are experiencing rapid growth, driven by the expansion of Internet access, digital transformation, and the increasing demand for flexible working arrangements. According to the Digital 2024 report, Vietnam currently has approximately 78.44 million Internet users, accounting for 79.1% of the population. In addition, the country has more than 72 million social media users and over 168 million active mobile connections (DataReportal, 2024). These conditions provide a favorable environment for the development of online job-matching platforms.

Furthermore, Vietnam currently has more than 2 million students enrolled in universities and colleges nationwide. This represents a young workforce with strong technological adaptability and skills that are highly relevant to the digital labor market, including graphic design, translation, content writing, video editing, presentation slide design, and basic programming.

On the demand side, Vietnam currently has more than 940,000 active enterprises, of which approximately 97–98% are small and medium-sized enterprises (SMEs). In addition, there are hundreds of thousands of household businesses, startups, and online stores. These entities often require short-term outsourced services but lack sufficient resources to recruit full-time employees.

According to the e-Conomy SEA 2024 report, Vietnam's digital economy reached approximately USD 36 billion in 2024 and continues to be among the fastest-growing markets in Southeast Asia. This growth has generated increasing demand for freelance services, remote work, and project-based outsourcing.

For the J4S project, this represents a highly promising market because the platform aims to connect skilled students with individuals, startups, and small businesses seeking short-term services such as design, translation, content writing, video editing, and basic programming. The coexistence of a large student workforce and growing outsourcing demand indicates that J4S's target market is substantial and possesses significant room for future expansion.

2.2.2 Market trend

In recent years, freelance work has become increasingly popular in Vietnam, particularly among young people and university students. Rather than seeking only traditional part-time jobs, many students now choose to provide skill-based services in order to generate additional income, gain practical experience, and build their professional portfolios.

At the same time, small businesses and startups are increasingly utilizing freelancers instead of hiring full-time employees in order to optimize costs and enhance operational flexibility. Services such as poster design, fanpage management, content writing, video editing, website design, and digital marketing are being outsourced more frequently due to their cost-effectiveness and rapid implementation.

Another notable trend is the strong growth of the Gig Economy. The widespread adoption of online working tools, electronic payment systems, and digital platforms has made the connection process between freelancers and clients faster, more convenient, and more efficient. Workers increasingly prefer flexibility in terms of working time and location rather than traditional employment arrangements.

In addition, the development of Artificial Intelligence (AI) is creating significant changes in the recruitment sector. Many businesses have begun using AI to analyze job requirements, evaluate candidate profiles, and recommend suitable talent. This creates opportunities for platforms such as J4S to integrate AI technologies in order to improve matching efficiency between students and clients.

Moreover, the remote working trend established after the COVID-19 pandemic continues to persist. Users increasingly prefer platforms that offer fast connections, transparency, security, and effective job management support. This provides favorable conditions for the future growth of short-term job-matching platforms.

These trends indicate that the market environment is highly supportive of the development of short-term employment platforms such as J4S, particularly within the student, startup, and SME segments.

The short-term job-matching market for students in Vietnam still possesses considerable growth potential because there are currently few specialized platforms focusing exclusively on this segment. At present, most students still search for clients through Facebook, community groups, or personal networks, while traditional recruitment platforms primarily focus on long-term employment and internship opportunities.

As the digital economy continues to expand, demand for outsourced short-term services is expected to increase in the coming years. At the same time, the number of students possessing digital skills continues to rise due to technological advancement, online learning opportunities, and practical training programs offered by universities.

According to projections by the Ministry of Information and Communications, the number of Internet users in Vietnam could exceed 100 million by 2029. This suggests that the digital environment will continue to expand and create additional opportunities for online platforms operating in recruitment, job matching, and freelance services.

For J4S, growth potential stems from its ability to address two market needs simultaneously. On the one hand, the platform helps students access income-generating opportunities, gain practical experience, and develop professional skills. On the other hand, J4S enables individuals, startups, and small businesses to access a flexible workforce at reasonable costs and with shorter recruitment timelines.

Furthermore, SMEs currently account for nearly 98% of all enterprises in Vietnam and contribute significantly to the national economy. This represents a substantial potential customer segment for J4S, as these businesses frequently require outsourced services such as design, marketing, social media management, content writing, and website development but often lack the resources to maintain specialized in-house teams.

In the future, together with the growth of remote work, digital transformation, and the expansion of the Gig Economy, Vietnam's freelance market is expected to continue growing strongly. This will provide opportunities for specialized platforms such as J4S to expand their user base, diversify service offerings, increase revenue, and strengthen their competitiveness in the market.

2.2.3 Market potential

The student freelance and short-term job-matching market in Vietnam demonstrates strong growth potential in both the current and future market landscape. This potential is driven by the combination of a large pool of digitally skilled students and the growing demand among businesses for cost-effective workforce solutions.

Firstly, Vietnam has a large population of university and college students, creating a substantial pool of potential freelancers with diverse skills and digital competencies. Many students possess valuable skills in areas such as content creation, translation, graphic design, video editing, and digital marketing. In addition, an increasing number

of students are actively seeking freelance and project-based opportunities to gain practical experience, develop professional skills, and earn additional income while studying. This trend creates a strong foundation for the growth of student-focused employment platforms such as J4S.

Secondly, the demand for outsourcing services continues to grow. Small and medium-sized enterprises (SMEs), startups, and online businesses often require flexible workforce solutions to reduce operational costs and improve efficiency. Instead of hiring full-time employees, many organizations prefer outsourcing short-term tasks such as content writing, presentation design, translation, and social media management to freelancers. This trend creates favorable opportunities for platforms that connect businesses with skilled student workers.

Finally, there remains a significant gap in the market for student-focused job-matching services. Most students currently rely on social media groups to find freelance opportunities, which often lack transparency and may expose users to potential scams. By offering identity verification, transparent rating systems, and AI-powered job matching, J4S can address these challenges and provide a safer and more efficient platform for both students and employers. As a result, J4S has the potential to establish a strong competitive position within this underserved market segment and support the long-term development of the student freelance ecosystem.

2.3 SWOT ANALYSIS

INTERNAL	FAVORABLE FACTORS	UNFAVORABLE FACTORS
	S – Strengths	W – Weaknesses
	- Focus on the student niche market with a micro-freelance model aligned with the gig economy trend: J4S focuses on short-term, flexible, and online jobs, meeting students' needs to earn additional income and gain practical experience in the digital economy era.	- Lack of strong brand awareness: J4S is a new platform, so users do not yet fully trust it or know about it widely.

	- Development team that understands student needs: The founding and operating team mainly consists of students, enabling them to understand the behaviors, needs, and difficulties that students encounter when searching for freelance jobs.	- Limited financial resources: Developing the website, AI, system security, and marketing requires significant costs while the startup is still small.
	- Integration of AI to support intelligent matching: AI helps analyze jobs, recommend suitable freelancers, and suggest deadlines and budgets, helping both parties save time.	- Lack of practical operational experience: The team mainly consists of students, so its experience in handling large-scale operations remains limited.
	- Two-way review system: Freelancers and customers can review each other, helping increase professionalism and transparency.	- Marketing and community-building activities are still limited: Due to limited financial and human resources, the project faces difficulties in promoting the brand, expanding the customer base and creating a strong market presence
	- Competitive labor costs: Student freelancers enable businesses, startups, and individuals to access freelance services at reasonable costs, contributing to reducing recruitment costs and increasing flexibility in workforce utilization.	- Technological infrastructure is still limited: The current system still depends on the resources of a student startup, so its ability to scale servers, perform technical maintenance, and operate on a large scale still faces many difficulties.
EXTERNAL	O – Opportunities	T – Threats

	- The freelance trend is growing strongly in the digital economy: The demand for flexible working arrangements and project-based hiring is increasing, creating favorable conditions for job connection platforms such as J4S.	- Strong competition from major recruitment and freelance platforms: Fiverr, Upwork, LinkedIn, YBOX, and other established platforms.
	- Students are increasingly seeking additional income and practical work experience: This represents a potential freelance workforce that aligns well with the platform's operating model.	- Legal regulations regarding data protection and electronic payments may change in the future: Changes in policies and legal requirements could lead to additional compliance costs and impact the platform's operations.
	- Many startups and small businesses have a need to hire short-term personnel at reasonable costs: This creates a potential customer market for J4S's services.	- Economic fluctuations may reduce demand for freelance hiring: During periods of economic uncertainty or downturn, businesses tend to cut costs and limit hiring for short-term projects.
	- AI and digital technologies are advancing rapidly: This enables J4S to enhance its matching capabilities, optimize user experience, and improve the operational efficiency of the platform.	- Risks related to data security and online payments are becoming increasingly complex: Threats such as data leaks, cyberattacks, and online fraud can affect the platform's reputation and operations.
	- The micro-freelance market in Vietnam remains largely underdeveloped: This provides J4S with an opportunity to be a	- The rapid pace of technological development creates constant pressure for innovation: The platform must continuously upgrade its systems and adopt

	pioneer and establish an early competitive advantage.	new technologies to maintain competitiveness and meet user expectations.
--	---	--

APPENDIX

* ASSESSING TEAM PERFORMANCE

Evaluation criteria will be based on:

- Progress in completing assigned tasks on time.
- Quality and accuracy of the completed work.
- Active participation in group discussions and idea contribution.
- Cooperation and support among team members.
- Responsibility and commitment to assigned duties.
- Communication and coordination throughout the project.
